SPECIFICATION

TITLE OF THE INVENTION

“GAMING DEVICE HAVING A MECHANICAL SECONDARY DISPLAY”

5

PRIORITY CLAIM

This application is a continuation-in-part of and claims the benefit of U.S. Patent Application No. 10/243,049, filed September 12, 2002.

10

A portion of the disclosure of this patent document contains material which is subject to copyright protection. The copyright owner has no objection to the photocopy reproduction by anyone of the patent document or the patent disclosure in exactly the form it appears in the Patent and Trademark Office patent file or records, but otherwise reserves all copyright rights whatsoever.

DESCRIPTION

The present invention relates in general to a gaming device, and more particularly to a wagering gaming device having a mechanical display which simultaneously reveals symbols or images to a player in an exciting and
5 entertaining manner.

BACKGROUND OF THE INVENTION

Gaming device manufacturers strive to make wagering gaming devices that provide as much enjoyment, entertainment and excitement as possible to
10 players. Providing interesting and exciting primary or base games and secondary or bonus games in which a player has an opportunity to win potentially large awards or credits is one way to enhance player enjoyment and excitement. Another way to enhance a player's enjoyment, entertainment and excitement with a gaming device is by including lights, sounds and other
15 visual or audio or audio-visual effects in the gaming machines.

Some known gaming devices use mechanical devices such as reels or wheels to enhance the attraction of the machines to players and also to enhance the player's game playing experience. These mechanical devices enable a player to see physical movements of a game, a portion of a game, or
20 a functional game event or element which increases the player's enjoyment of the game.

To increase player enjoyment and excitement, it is desirable to provide new and different mechanical devices in conjunction with wagering gaming devices.

SUMMARY OF THE INVENTION

5 One embodiment of the present invention includes a gaming device having a cabinet which supports a primary display. The primary display exhibits a primary wagering game to a player and the gaming device enables the player to play the primary wagering game displayed by the primary display. In one embodiment of the present invention, the gaming device enables a
10 player to play a poker game such as a video draw poker game. A housing is connected to the top of the gaming device cabinet. In one embodiment, the housing supports an axle. A plurality of aligned mechanical members or display plates are suitably attached to the axle. The display plates are pivotally or rotatably connected to the axle in such a manner that in at least
15 one position the display plates are horizontally aligned with each other. In this horizontal alignment position, the front display plate will block from the view of the player at least a portion of at least one of the display plates positioned behind it. An actuator or a plurality of actuators are coupled with the display
20 plates to pivot or rotate the display plates to multiple positions such as horizontal or vertical positions. In one embodiment, the actuators cause the mechanical members to rotate in a manner such that each display plate may rotate independently of each other.

In one embodiment of the present invention, the display plates are horizontally aligned so that in an initial position the display plates in front block at least a portion of the display plates in the back from the view of a player. The gaming device's processor causes the actuators to rotate the display
5 plates from the initial position so that the player is able to view the display plates behind the front display plates. Thus, the player initially viewing the mechanical display may only see the entire first or front display plate in the horizontal alignment. The processor causes the display plates to rotate to one or either side until a selected display plate can be seen.

10 It should be appreciated that in one embodiment the display plates are directly attached to the actuators which are supported by the housing. It should also be appreciated that other suitable mechanisms may be employed in accordance with the present invention.

The display plates may include images, symbols, awards, values or
15 combinations thereof. In one embodiment of the present invention, each display plate includes a different image, symbol, award, value or combination thereof.

In one embodiment of the present invention, the display plates display gaming cards. The gaming cards are initially horizontally aligned with each
20 other so that a player only sees the front card. Upon a triggering event in the primary poker game (as indicated above), the processor selects a gaming card to be displayed by the secondary display device and determines which display plate displays the selected gaming card. The processor causes the actuators

to rotate the display plates having other gaming cards positioned in front of the display plate having the selected gaming card as well as that display plate so that the display plate having the selected card is revealed to the player. The player will see the cards rotating to either side or in some cases to one side
5 until the selected card is displayed.

A player will feel a greater sense of anticipation and excitement from the present invention because the player will preferably be shown a number of images or symbols on other display plates before being shown the image or symbol selected by the gaming device. It should be appreciated that in one
10 embodiment the displayed card can be used in conjunction with one or more of the video poker hands to the player by the display device. It should also be understood that the gaming cards displayed by the display plates may be used in poker games or other gaming devices as wild cards or additional or bonus cards given to or usable by the player during the course of the game.

15 In one embodiment of the present invention, the housing includes a non-viewable area. When the display plates move into a position in the non-viewable area, the images displayed by the display plates cannot be seen by the player. In one embodiment, the display plates remain in the non-viewable area until one or more of the images displayed by the display plates are
20 selected by the processor. The processor causes the selected display plate(s) to move from the non-viewable area into a viewable area where plate(s) can be seen by the player. If more than one of the display plates are selected, the display plates are moved into a variety of positions so that each image

displayed by each display plate can be seen by the player. In this manner, the player will see a plurality of images or values displayed by the display plates. Thus, it should be appreciated that symbols or images or multiple display plates may be provided or usable to the player in conjunction with a game
5 such as a primary game or secondary game.

In one embodiment, the housing encloses the plurality of display plates. It should be appreciated that the housing may also display images preferably corresponding to the theme of the game played on the gaming device. It should also be appreciated that the housing may also support different display
10 devices and/or indicators in addition the mechanical display plates.

In an alternative embodiment, the secondary mechanical display includes a secondary mechanical display including a housing connected to the top of the gaming device cabinet and at least one and preferably, a plurality of first and second display plates independently movably connected to the
15 housing where the first and second display plates include first and second images such as first and second symbols, respectively. In one embodiment, the first and second display plates include first and second axes of rotation where the axes of rotation are different. In one embodiment, they are substantially parallel. Therefore, the first display plates move independently of
20 and in generally in different directions from the second display plates. In one embodiment, the first display plates and the second display plates are adapted to simultaneously move toward and away from each other. In another embodiment, each of the first display plates and each of the second display

plates are adapted to move toward and away from each other in a designated sequence or order. The first and second display plates may simultaneously move toward or away from each other, sequentially move toward and away from each other or move in any suitable predetermined or randomly
5 determined order or sequence in a game.

In one embodiment, each of the first display plates and each of the second display plates include first axes of rotation and second axes of rotation which are different. In a further embodiment, at least two of the first axes of rotation are different from at least two of the second axes of rotation. The first
10 and second display plates may include any suitable axes of rotation which enables the first and second display plates to move toward and away from each other.

In another embodiment, at least one of the first symbols and at least one of the second symbols are different. In a further embodiment, all of the
15 first and second symbols are different. It should be appreciated that the first and second symbols may include awards, values, modifiers, free spins, free games, game elements or any suitable award, awards or outcomes.

In one embodiment, the first and second display plates include first and second actuators which independently move each of the first and second
20 display plates relative to the housing. The first actuators are attached to the first display plates and the second actuators are attached to the second display plates. The gaming device causes the actuators to move which thereby moves the display plates. It should be appreciated that any suitable

actuators or motors may be used to move each of the first and second display plates.

When a bonus game is triggered, the gaming device causes the first and second display plates to continuously, independently move toward and away from each other. The gaming device selects at least one of the first and second symbols to indicate to the player and then causes the display plates including the selected first and second images to move and indicate those symbols to the player in the game. The gaming device provides the player with an outcome such as an award based on at least one of the indicated first and/or second symbols on the first and second display plates.

In one embodiment, a control panel including several inputs is in communication with the secondary mechanical display. A first input controls the movement of the first display plates. A second input controls the movement of the second display plates. A third input controls the movement of both of the first and second display plates. A fourth input enables a player to accept or reject an outcome such as an indicated symbol or symbols in a game. If the player rejects an outcome displayed to the player by the first and second display plates, the player picks and activates one of the inputs described above to display another outcome based on the symbols indicated by at least one of the first display plates, at least one of the second display plates or by at least one of the first and second display plates.

In a further embodiment, the gaming device includes at least one Light Emitting Diode ("L.E.D.") attached to the housing, which is operable to direct

light at one or more of the first and second display plates to better enable a player to view the first and second images on the first and second display plates. Any suitable lighting mechanism or illumination device may be used to illuminate the first and second display plates.

5 In another embodiment, a light display, including at least one substantially transparent panel and at least one light panel, is positioned behind the first and second display plates and connected to the housing. The substantially transparent panel is positioned adjacent to and in front of the light panel. In one embodiment, the light panel includes a plurality of L.E.D.'s which
10 are attached to the light panel to form a picture or any other suitable image. In one embodiment, the transparent panel includes an opaque coating or tint which prevents a player from viewing the L.E.D.'s until the L.E.D.'s are illuminated in a game. Once the L.E.D.'s are illuminated, the picture or image formed by the L.E.D.'s becomes visible and viewable by a player in the game.
15 In one embodiment, the L.E.D.'s are independently controlled by the processor to simultaneously or alternately illuminate one or more of the L.E.D.'s to create different visual effects. In another embodiment, the L.E.D.'s include one or more different color L.E.D.'s to enhance the visual effects in a game or games.

 It should be appreciated that a triggering event which causes the
20 actuation or activation of the mechanical display plates can occur in a primary game, a secondary game or a sub-game of a gaming device.

 It is therefore an object of the present invention to provide a new and exciting display for wagering gaming devices.

Other objects, features and advantages of the invention will be apparent from the following detailed disclosure, taken in conjunction with the accompanying sheets of drawings, wherein like numerals refer to like parts, elements, components, steps and processes.

BRIEF DESCRIPTION OF THE DRAWINGS

Figs. 1A and 1B are front elevational views of general embodiments of the gaming device of the present invention.

Fig. 2 is a schematic block diagram of the electronic configuration of one embodiment of the gaming device of the present invention.

Fig. 3 is a front perspective view of the display device illustrating one embodiment of the present invention.

Fig. 4 is a front elevational view of the display device illustrating one embodiment of the present invention, wherein the display plates pivot about the axle.

Fig. 5. is a side elevational view of the display device illustrating one embodiment of the present invention.

Fig. 6 is a front perspective view of a plurality of display plates in one embodiment of the present invention where the display plates are connected to an actuator.

Fig. 7. is a front perspective view of the display device illustrating another embodiment of the present invention, wherein a number of display plates pivot independently.

Fig. 8 is a front elevational view of the display device illustrating another embodiment of the present invention, wherein a plurality of display plates have moved to reveal a selected image.

Fig. 9 is a front elevational view of the display device illustrating another embodiment of the present invention, wherein the plurality of images displayed by the display plates include symbols and values.

Fig. 10 is an elevation view of an alternative embodiment of the gaming
5 device of the present invention illustrating a mechanical display device mounted to the top of the cabinet of the gaming device.

Fig. 11 is a front perspective view of the alternative embodiment of Fig. 10 illustrating the mechanical display device.

Fig. 12 is a front perspective view of the mechanical display device of
10 Fig. 11 without the housing.

Fig. 13 is a top view of the embodiment of Fig. 12.

Fig. 14A is a front view of one embodiment of a display mechanism of the present invention.

Fig. 14B is a side view of the embodiment of Fig. 14A.

15 Fig. 15A is a front view of the alternative embodiment of the present invention where the display plates sequentially move to indicate the symbols included on the display plates to a player.

Fig. 15B is a front view of the alternative embodiment of the present invention illustrated in Fig. 15A where two symbols are indicated by the display
20 plates.

DETAILED DESCRIPTION OF THE INVENTION

Gaming Device and Electronics

Referring now to the drawings, two embodiments of the gaming device of the present invention are illustrated in Figs. 1A and 1B as gaming device 10a and gaming device 10b, respectively. Gaming device 10a and/or gaming device 10b are generally referred to herein as gaming device 10. Gaming device 10 in one embodiment has the controls, displays and features of a conventional video poker machine. It is constructed so that a player can operate it while standing or sitting, and gaming device 10 is preferably mounted in a cabinet. However, it should be appreciated that gaming device 10 can be constructed as a pub-style table-top game (not shown) which a player can operate preferably while sitting. Furthermore, gaming device 10 can be constructed with varying cabinet and display designs, as illustrated by the designs shown in Figs. 1A and 1B.

Gaming device 10 can incorporate any primary game such as slot, poker, blackjack or keno, and any of the bonus triggering events and bonus games associated with these primary games. The symbols and indicia used on and in gaming device 10 may be in mechanical, electrical, electronic or video form.

As illustrated in Figs. 1A and 1B, gaming device 10 includes a coin slot 12 and bill acceptor 14 where the player inserts money, coins or tokens. The player can place coins in the coin slot 12 or paper money or ticket vouchers in the bill acceptor 14. Other devices could be used for accepting payment such

as readers or validators for credit cards or debit cards. When a player inserts money in gaming device 10, a number of credits corresponding to the amount deposited is shown in a credit display 16. After depositing the appropriate amount of money, a player can begin the game by pushing a play or deal button 20. The play or deal button 20 can be any activator used by the player which starts any game or sequence of events in the gaming device.

As shown in Figs. 1A and 1B, gaming device 10 also includes a bet display 22 and a bet one button 24. The player places a bet by pushing the bet one button 24. The player can increase the bet by one credit each time the player pushes the bet one button 24. When the player pushes the bet one button 24, the number of credits shown in the credit display 16 decreases by one, and the number of credits shown in the bet display 22 increases by one. Other bet or wager indicators such as a bet max button may also be employed in the gaming device of present invention.

A player may cash out and thereby receive a number of coins corresponding to the number of remaining credits by pushing a cash out button 18. When the player cashes out, the player receives the coins in a coin payout tray 28. The gaming device 10 may employ other payout mechanisms such as credit slips redeemable by a cashier or electronically recordable cards which keep track of the player's credits.

Gaming device 10 also includes a plurality of display devices. As shown in Fig. 1A, one embodiment includes a central display device 30 and also a mechanical display device 60. Fig. 1B includes a central display device

30 as well as an upper display device 32 and a mechanical display device 60. The gaming device 10 in one embodiment displays a plurality of cards 34 in video form by the central display device 30 and a plurality of cards 64 in mechanical form by the mechanical display device 60. The central display device can be any viewing surface such as glass, a video monitor or screen, a liquid crystal display, display plate or any other display mechanism. One preferred representation of the cards 34 is in video form wherein the preferred display device is a video monitor. The cards 64 are also preferably displayed in mechanical form and one preferred display device includes a plurality of display plates 64. The cards portray one or more decks of cards used in conventional poker games. The display plates may alternatively display a variety of images or symbols such as bells, hearts, fruits, numbers, letters or other images which may correspond to a theme associated with the gaming device. Furthermore, the gaming device 10 preferably illustrates speakers 36 for producing sound such as music.

As illustrated in Fig. 2, the general electronic configuration of gaming device 10 preferably includes: a processor 38; a memory device 40 for storing program code or other data; a central display device 30; an upper display device 32; a mechanical display device 60; a sound card 42; a plurality of speakers 36; and one or more input devices 44. The memory device 40 can include random access memory (RAM) 46 for storing event data or other data generated or used during a particular game. The memory device 40 can also include read only memory (ROM) 48 for storing program code which controls

the gaming device 10 so that it plays a particular game in accordance with applicable game rules and pay tables. The memory device preferably stores program code which enables the gaming device to play a video poker game.

As illustrated in Fig. 2, the player preferably uses the input devices 44,
5 such as the deal button 20, the bet one button 24, the hold cards buttons 24 and the cash out button 18 to input signals into gaming device 10. In certain instances it is preferable to use a touch screen 50 and an associated touch screen controller 52 instead of a conventional video monitor display device. Touch screen 50 and touch screen controller 52 are connected to a video
10 controller 54 and processor 38. A player can make decisions and input signals into the gaming device 10 by touching touch screen 50 at the appropriate places. As further illustrated in Fig. 2, the processor 38 can be connected to coin slot 12 or bill acceptor 14. The processor 38 can be programmed to require a player to deposit a certain amount of money in order to start the
15 game.

It should be appreciated that although a processor 38 and memory device 40 are preferable implementations of the present invention, the present invention can also be implemented using one or more application-specific integrated circuits (ASIC's) or other hard-wired devices, or using mechanical
20 devices (collectively or alternatively referred to herein as a "processor"). Furthermore, although the processor 38 and memory device 40 preferably reside on each gaming device 10 unit, it is possible to provide some or all of their functions at a central location such as a network server for

communication to a playing station such as over a data network such as a local area network (LAN), wide area network (WAN), Internet connection, microwave link, and the like. The processor 38 and memory device 40 are generally referred to herein as the “computer” or “controller.”

5 With reference to Figs. 1A, 1B and 2, to operate the gaming device 10, in one embodiment the player must insert the appropriate amount of money or tokens at coin slot 12 or bill acceptor 14 and then push the deal button 20. In one embodiment, the processor 38 enables the player to play a conventional game of video poker. In another embodiment, the controller enables a player
10 to play a multi-hand version of video poker. In one embodiment, in either a bonus scheme or the primary game, the mechanical display 60 is used to display a gaming card 64 used in the primary or bonus game. In one embodiment, the mechanical display 60 is used to display the award(s) or value(s) which are provided to the player.

15

The Mechanical Display Device

In one embodiment of the present invention, the gaming device 10 includes a primary display 30, and a secondary mechanical display 60 as illustrated in Figs. 1A and 1B. The secondary mechanical display is preferably
20 connected to the top of the gaming device cabinet. The secondary mechanical display includes a housing 62 which supports an axle 66 along which a number of display plates 64 are suitably connected as shown in Fig. 3. In this embodiment, each display plate 64 is pivotally or rotatably connected to the

axle 66 so that each display plate 64 may move to a horizontal, vertical or other suitable position as shown in Fig. 4.

The display plates 64 in at least one position are horizontally aligned with each other as shown in Fig. 3 and in Fig. 5. Thus, in at least one position,
5 a player will only see the entire image displayed by the front most display plate 64 as shown in Fig 3. The front most display plate at least partially blocks from the view of the player the display plates which are behind the front most display plate.

In one embodiment of the present invention, at least one actuator 68 is
10 connected to or coupled with each of the display plates 64 as shown in Fig. 6. In another embodiment of the present invention, the display plates 64 may be connected directly to the actuators 68 and are not connected to an axle. Such actuators 68 may in one embodiment be supported by the housing. It should be appreciated that the actuator may be any suitable device which causes the
15 display plates to rotate such as a solenoid, a motor, a stepper motor, a biasing device (such as a spring or weighted means) or a combination of these devices.

The actuators 68 cause the display plates 64 to rotate independently of each other as shown in Fig. 7. Each display plate 64 may move to any
20 suitable position, horizontal, vertical or at a non-horizontal or vertical angle, irrespective of the positions of the other display plates 64. Since each of the display plates 64 may also move independently of the other display plates 64,

multiple display plates could be moving in different directions and at different rates and at different times.

In one embodiment of the present invention, the processor 38 is in communication with the primary display 30 which displays a game and following a triggering event in the game, the processor 38 selects an image associated with one of the display plates 64 to be displayed. The processor 38 then determines which of the display plates 64 displays the selected image. The processor 38 causes the display plates 64 in front of the display plate 64 displaying the selected image to rotate and reveal that display plate 64 displaying the selected image as shown. In Fig. 8, the display plate including the Six of Hearts 64c and the display plate including the Five of Clubs 64b move to reveal the selected display plate which includes the Ace of Diamonds 64a. In an alternative embodiment, the display plate having the selected image could also move. In a further alternative embodiment, all of the displays plates can move. In such embodiment, the selected display plate will ultimately stop in a position viewable by the player and indicated to be the selected display plate. In one alternative embodiment, the display plate having the selected image moves out of alignment with the other display plates.

In one embodiment of the present invention, the images displayed by the display plates are cards used in a conventional poker game. It should be appreciated that the present invention can be used in other card games or in other types of games. The processor enables a player to play a video poker game or some other card game using at least one display and upon a

triggering event in the video card game, the processor selects one of the cards to be displayed by the mechanical display. The processor then determines which display plate displays the selected card and causes the display plates in front of the selected symbol to move in order to reveal the selected card to a player.

It should be appreciated that the cards displayed by the mechanical display could be used in a variety of ways, such as wild cards, or additional cards given to the player during the course of the card game.

In one embodiment of the present invention, the display plates 64 display images other than conventional gaming card symbols. The images displayed by the display plates include a plurality of value symbol as illustrated in Fig. 9. The housing 60 encloses the display plates 64 and the housing 60 itself displays images or symbols relating to the theme of the game played on the gaming device. The gaming device in this embodiment includes a non-viewable area 70, wherein the images displayed by the display plates 64, which are in a position in the non-viewable area 70, are hidden from the view of the player. In one embodiment, the processor 38 causes the display plates 64 to remain hidden from the view of the player until one or more of the images displayed by the display plates 64 are selected. The processor causes the display plate or plates 64 displaying the selected image or images to move into an area 72 where the player can view the selected image(s). As illustrated by Fig. 9, the player can view a plurality of value symbols. The display plates 64 are in a plurality of positions where the player can view the selected images

simultaneously. In this manner the player will feel excitement and anticipation as one or more of the value symbols displayed by the display plates 64 may be awarded to the player.

In one embodiment of the present invention, the display plates are in
5 initial positions wherein a player can view the images displayed by each display plate. The processor selects the image(s) to be displayed to the player and causes the display plates displaying the non-selected images to move into a position in the non-viewable area, so that the only images the player sees are the images selected by the processor.

10 Referring to Figs. 10, 11, 12, 13, 14A and 14B, an alternative embodiment of the present invention is illustrated where the gaming device 10 includes a primary display 30 and a secondary mechanical display 100. The secondary mechanical display includes a plurality of display mechanisms 108 each being operable to move at least one display plate 112. In one
15 embodiment, upon a triggering event in a game, the display mechanisms 108 on the left side of the housing move the display plates 112 toward and away from the opposing display mechanisms on the right side of the housing. Similarly, the display mechanisms on the right side of the housing move the display plates toward and away from the display mechanisms on the left side
20 of the housing. Therefore, both sets of the display plates of the display mechanisms are independently moving back and forth. In this embodiment, the gaming device selects at least one of the images or symbols on the display plates and causes one of the display plates to display or indicate the selected

symbol to a player. In one embodiment, an opaque panel 106 is connected to the housing to substantially prevent a player from viewing the display plates which do not include the selected symbol or symbols. It should be appreciated that the display mechanisms may move the display plates in any suitable order or sequence.

In one embodiment, the secondary mechanical display 100 includes a housing 101, a frame 105 connected to the housing and a plurality of display mechanisms 108 which are connected to the frame 105. In one embodiment, the frame 105 includes a bottom panel 107e, two side panels 107c and 107d suitably connected to the bottom panel 107e, a front panel 107a connected to the bottom panel and to the two side panels and a rear panel 107b connected to the bottom panel and the two side panels. In one embodiment, the frame 105 is manufactured using metal. It should be appreciated that the frame 105 may be manufactured using any suitable material such as a suitable metal.

The frame 105 is connected to the lower portion of the housing 101 using suitable connectors such as screws or other suitable connecting devices. Similarly, the housing 101 encloses the display mechanisms and is connected to the top of the cabinet of the gaming device 10 using any suitable connectors or connecting devices. In another embodiment, the housing 101 is separate from the gaming device and positioned in any suitable location in relation to the gaming device. It should be appreciated that the housing may be a glass housing or any other suitable cover.

In one embodiment, the secondary mechanical display 100 includes thirteen display mechanisms 108 including thirteen display plates 112 as shown in Figs. 12 and 13. It should be appreciated that any suitable number of display mechanisms may be employed in a game. In one embodiment, a plurality of first display mechanisms 108a to 108g are positioned on and secured to the left side of the frame 105 as a player views the frame 105 from the front of the gaming device. Similarly, a plurality of second display mechanisms 108h to 108m are positioned adjacent to and opposing the first display mechanisms 108a to 108g and are secured on the right side of the frame 105 as a player views the frame from the front of the gaming device.

In this embodiment, the first display mechanisms 108a to 108g include a first axis of rotation and the second display mechanisms 108h to 108m include a second axis of rotation, where the first and second axes of rotation are different. In another embodiment, the first display mechanisms 108a to 108g and the second display mechanisms 108h to 108m are each associated with an axis of rotation. In this embodiment, at least two of the axes of rotation associated with first display mechanisms 108a to 108g and at least two of the axes of rotation associated with second display mechanisms 108h to 108m are different. It should be appreciated that one, a plurality of or all of the axes of rotation associated with the display mechanisms may be different.

In one embodiment, the first and second display mechanisms 108 are staggered or alternatively positioned so that the second display plates 112h to 112m are positioned between the first display plates 112a to 112g when the

first and second display plates are in the down position or positioned closest to the bottom panel 107e of the frame 105. In this embodiment, each display plate 112 overlaps an adjacent display plate or obscures at least a portion of the adjacent display plate. In another embodiment, the first and second display mechanisms are positioned on the left and right sides of the frame 105 and are spaced sufficiently apart so that the first and second display plates of the first and second display mechanisms do not overlap or obscure each other. It should be appreciated that the display mechanisms may be placed and secured in any suitable positions or areas on the frame 105.

10 In one embodiment, the display mechanisms 108 each include a display housing 116, a display member 117 movably connected to the display housing, and a drive mechanism 118, which is adapted to control the movement of the display member 117. In one embodiment, the display housing 116 includes a base support or base 119 which is positioned and connected to the frame 105. In one embodiment, the base 119 is integrally formed with the frame 105. In another embodiment, the base 119 is connected or otherwise attached to the frame 105 using suitable connectors such as screws or other suitable connecting devices. In one embodiment, the base 119 includes alignment pins 136a, 136b and 136c, which align with corresponding receptacles (not shown) in the frame 105 to position and secure the base 119 to the bottom panel 107e of the frame 105. In addition, alignment pins 136d and 136e position and align the display housing 116 with corresponding receptacles (not shown) formed on one of the side panels 107a

or 107b depending on which side of the housing 101 the display mechanisms are positioned. The display housing 116 thereby maintains the position of each display mechanisms in the housing so that the display mechanisms do not move out of position during a game.

5 In one embodiment, the display mechanisms 108 each include at least one display member 117, which is independently movably connected to the display housing 116. Each of the display members 117 includes a display plate 112 and a plate support 114. In one embodiment, the display plate 112 includes an image or symbol such as a value, a modifier, a prize, a game
10 element such as a playing card, or any other suitable image. In one embodiment, at least two of the symbols on the display plates are different. In another embodiment, all of the symbols on the display plates are different. As shown in drawings, in one embodiment, the display plates are flag-shaped and correspond to a theme associated with the gaming device. It should be
15 appreciated that the display plates may be any suitable shape and correspond to any suitable theme or themes associated with the gaming device.

 In one embodiment, the display plate 112 is connected to one end of the plate support 114 using suitable connectors or connecting devices. In another embodiment, the display plate 112 is integrally formed with the end of
20 the plate support 114. The plate support 114 is a generally elongated tube-like member which supports the display plate 112. An opposite end of the plate support 114 is connected to the drive mechanism 118.

In one embodiment, the drive mechanism 118 is adapted to move the plate support 114 to one of several different positions, which simultaneously moves the display plate 112 to the same positions. In this embodiment, the drive mechanism includes an actuator 110, a drive shaft 126 movably
5 connected to the actuator, a control shaft 124 and a drive belt 128 which couples the drive shaft with the control shaft. In one embodiment, the control shaft 124 is rotatably connected to the display housing 116 and includes a control member 121 which is connected to one end of the display support 114. The control shaft 124 also includes a flange member 123 which is generally
10 cylindrically shaped and has a smaller diameter than the diameter of the control member 121. The flange member 123 projects generally transversely from the surface of the control member 121 and includes a small groove or similar channel (not shown). The groove is adapted to receive one end of the coupling member 128 to maintain frictional contact between the coupling
15 member and the flange member. In one embodiment, the control shaft 124 defines a center opening 125 which aligns with a corresponding opening defined in the display housing 116. The opening is formed to receive a corresponding connector such as a screw 130, which rotatably connects the control shaft 124 to the display housing 116.

20 In one embodiment, the drive shaft 126 is rotatably coupled to an actuator such as a suitable motor 110, which is connected to the display housing 116 using a suitable motor mount or motor bracket 111. The motor mount or motor bracket 111 is connected to the display housing 116 using

suitable connectors. In one embodiment, the drive shaft 126 defines an opening for receiving a rotating member such as axle 133. In one embodiment, one end of the axle 133 is inserted and secured to the motor 110. The second end of the axle is inserted into and secured in the opening
5 defined by the drive shaft 126. It should be appreciated that the axle 133 may be integrally formed with the drive shaft, connected to the drive shaft or secured to the drive shaft using any suitable connectors or connecting methods. In one embodiment, a processor or similar control causes the motor to rotate the axle 133 which in turn, causes the drive shaft 126 to
10 simultaneously move or rotate to one or more designated positions. In one embodiment, the drive shaft 126 includes a groove or similar channel (not shown) formed in the outer surface of the drive shaft for receiving the drive belt 128.

In one embodiment, the drive belt or band 128 is positioned on and
15 frictionally engages the grooves or channels formed in the outer surfaces of the flange member 123 and the drive shaft 126 as shown in Fig. 14A. The drive belt 128 is manufactured using a suitable material such as a durable rubber which stretches about both of the flange member and the drive shaft. It should be appreciated that the drive belt may be manufactured using any
20 suitable material and may be any suitable size or shape. The drive belt 128 couples the drive shaft 126 to the control shaft 124 so that the control shaft 124 moves simultaneously with the movement of the drive shaft 126. In one embodiment, the motor 110 rotates the drive shaft 126 which simultaneously

causes the drive belt 128 and the control shaft 124 to rotate. It should be appreciated that the motor 110 may be a stepper motor or any other suitable motor and may intermittently or continuously rotate the drive shaft 126 to control the movement of the display plates 112.

5 In one embodiment, position sensors 132a and 132b or other suitable sensing devices are attached to the control member 121 of the control shaft 124 to sense and determine the radial position of the control shaft 124 at a designated point or points in time during operation. The position sensors 132a and 132b are adapted to communicate the determined position of the control
10 shaft 124 and thereby the position of the display plate 112 to the processor which controls the movement of the display plate 112.

 In one embodiment, the display mechanisms 108 each include a circuit board 120 having an interface card 122 which is connected to main control boards or main circuit boards such as the main control board 127a on the left
15 side of the frame as one views the front of the gaming device and main control board 127b on the right side of the frame. The main control boards 127a and 127b are adapted to facilitate communication between the position sensors 132a and 132b and the processor connected to each of the display mechanisms. In one embodiment, the interface card 122 slides into or inserts
20 into the main control board 127a or 127b by engaging a corresponding slot (not shown) on the circuit board. Additionally, a pin 134 or other suitable connector is inserted into a receptacle on the base 119 to secure the base and the display housing 116 to the bottom panel 107e of the frame 105 to prevent

the interface card 122 from moving and separating from the main control boards 127a and 127b.

In one embodiment, the display mechanism 108 moves the display plate 112 to one of several positions to display an image or symbol on the display plate to a player in a game. In particular, the processor communicates with the display mechanism 108 by transferring electrical signals from the processor to the motors 110 of one or more of the display mechanisms 108 via suitable wiring, the circuit board or control boards 127a and 127b, and the corresponding interface cards 122 associated with each of the display mechanisms. The interface card 122 and circuit board 120 are adapted to receive the electrical signals from the processor and communicate these signals to the motor 110 to activate the motor.

Once activated, the motor 110 simultaneously rotates the drive shaft 126, drive belt 128 and control shaft 124 to a desired radial position or positions relative to the frame 105. Correspondingly, the control shaft 124 rotates the plate support 114 which simultaneously moves the display plate 112 to the desired position. The position sensors 132a and 132b sense or track the radial position of the control shaft 124. Therefore, when the desired position of the display plate 112 is achieved, the position sensors 132a and 132b communicate with the processor via the wiring, interface card 122 and the corresponding main control board 127a or 127b to de-activate the motor 110 and stop the movement of the shaft and corresponding display plate at the desired position.

In one embodiment, each motor 110 includes a motor connector 138 and a motor cable 140. The motor cable 140 is connected to the motor 110 at one end and the motor connector 138 at the other end. The motor connectors are each connected to the interface cards 122. Therefore, the motor
5 connectors and the motor cables enable the processor to communicate with each of the motors 110 via each of the interface cards 122. In one embodiment, each motor 110 is a separate motor which is independently controlled by the processor. The processor causes the motors to move the display plates independently so that each of the display plates, a plurality of
10 the display plates are all of the display plates may move simultaneously or intermittently to the same position or positions or to several different positions.

In one embodiment, a plurality of inputs 102 are in communication with the display mechanism 108 and enable a player to pick which set of display mechanisms the player wants to operate in a game such as a bonus game. In
15 one embodiment, input 102a controls the left set of display mechanisms 108 (as a player views the housing from the front of the gaming device) and causes the movement of one or more of these display mechanisms when the player presses or otherwise activates this input. Input 102b enables a player to pick and activate at least one of the display mechanisms 108 in each of the left and
20 right sets of display mechanisms 108. Input 102c enables a player to pick and activate at least one of the display mechanisms 108 on the right side of the housing as a player views the housing from the front of the gaming device. In addition, input 102d enables the player to accept or reject a symbol or

combination of symbols indicated by one or more of the display mechanisms displayed to the player by the gaming device. In one embodiment, a prompt display or prompt 104 indicates instructions such as an action to be taken by the player in the game or displays any other suitable message to the player.

- 5 The prompt may be any suitable type of display such as a video display or other display device.

Referring now to Figs. 15A and 15B, one alternative embodiment of the secondary mechanical display of the present invention is illustrated where the secondary mechanical display includes a frame 205 and a plurality of first
10 display mechanisms 208a including a plurality of first display plates 212a and a plurality of second display mechanisms 208b including a plurality of second display plates 212b. In this embodiment, the first display mechanisms 208a are positioned and secured to one side of the frame and the second display mechanisms 208b are positioned and secured to the opposite side of the
15 frame. The first and second display mechanisms 208a and 208b are positioned such that the first and second display plates 212a and 212b of the first and second display mechanisms are alternately positioned as described above. The processor causes the motors (not shown) to sequentially move the display plates 212a and 212b until a selected symbol on a display plate is
20 indicated or displayed to a player. In Fig. 15A, the sequential movement of the display plates is illustrated where each of the display plates 212a and 212b move continuously from a first radial position 207 to a second radial position 209 until the movement of the display plates is stopped by the processor to

indicate at least one selected symbol or image on the display plates of the display mechanisms to the player.

In this embodiment, the selected display plate 212a or 212b is displayed to a player in the first position 207. It should be appreciated that the selected display plate may be moved to and displayed to a player in any suitable position that is viewable by a player.

Referring to Fig. 15B, in one example, the processor selects two symbols or images to display to a player in a game. The processor then causes the display mechanisms to move the display plates in a wave-like pattern. The display mechanisms continue to move the display plates for a designated time period and then displays the display plates including the selected symbols to a player in the game. In this example, the first display plate 212a includes one of the selected symbols which is a value of one hundred (213a) and the second display plate 212b includes the other selected symbol which is a modifier or multiplier 2X (213b). It should be appreciated that the images included on the display plates may be any suitable images, symbols, values, modifiers, prizes, or any other suitable images, symbols or prizes desired by the game implementor. In this example, the indicated value of one hundred is multiplied by the multiplier 2X to provide a total award of two hundred to the player in the game. It should be appreciated that the symbols or images indicated by the display plates may be combined in any suitable manner to provide an outcome to the player in the game.

Referring now to Fig. 10, in one embodiment as described above, once the outcome such as the award or awards are indicated and displayed to a player, the gaming device enables the player to accept or reject the award or awards indicated by the display plates 112 of the display mechanisms 108. If the player accepts the award or awards indicated by the display mechanisms, the player presses or activates input 102d and the gaming device provides the award or awards to the player in the game.

If the player rejects the award or awards displayed to the player by the display mechanisms 108, the gaming device enables the player to choose one of three different options to cause the secondary mechanical display to display another award or awards to the player in the game. As described above, the player may choose to activate one of three inputs 102a, 102b or 102c located on the front of the gaming device. If the player presses and activates button 102a, the gaming device causes at least one of the display mechanisms 108 located on the left side of the housing (as the player views the housing from the front of the gaming device) to move to indicate or display another award to the player. The gaming device selects at least one award associated with the display plates of the display mechanisms to provide to the player and causes the display mechanism 108 which includes the selected award to display the award to the player so that the award is viewable by the player.

Alternatively, if the player presses and activates button 102c, the gaming device causes at least one of the display mechanisms 108 on the right side of the housing (as the player views the housing from the front of the

gaming device) to move. The gaming device then selects an award associated with these display mechanisms and causes the display mechanism including that award to stop and indicated or display the selected award to the player in the game. In this embodiment, the gaming device stops the
5 movement of the display plate so that the display plate is in the up position or position 207 as shown in Fig. 15A. The gaming device then provides the award indicated by the display plate of the display mechanism to the player.

The player may alternatively select button 102b which activates both sets of display mechanisms 108 so that both sets of display mechanisms are
10 moving sequentially or in a wave-like pattern. In this embodiment, the display mechanisms 108 are positioned so that the display plates of the display mechanisms are alternatively positioned and moved so that each display plate of the display mechanisms are moving from a straight-up position such as position 207 and Fig. 15A to a down position such as position 209 and Fig.
15 15A. Each display mechanism causes each display plate to move up and down until the gaming device selects one or more of awards to display to the player. The gaming device then causes the display mechanism or mechanisms to display the selected awards to the player while obscuring the awards or hiding the awards on the display mechanism which do not include
20 the selected awards. It should be appreciated that the display plates on the display mechanisms 108 may move in any suitable order or matter desired by the game implementor.

In a further alternative embodiment, the housing 101 or the frame 105 includes at least one Light Emitting Diode (L.E.D.), which directs light at one or more of the first and second display plates to better enable a player to view the first and second images on the first and second display plates. The housing or
5 frame may include one or a plurality of L.E.D.'s to direct light at the display plates. In one embodiment, the L.E.D.'s are adjustable to direct light at a specific area in the housing or at a specific display plate or plates in a game. It should be appreciated that any suitable lighting mechanism may be used to illuminate and/or direct light at the first and second display plates in a game.

10 In another alternative embodiment, a light display (not shown), including at least one substantially transparent panel and at least one light panel, is positioned behind the first and second display plates and connected to the housing using a suitable connector or connectors. The substantially transparent panel is positioned adjacent to and in front of the light panel. In
15 one embodiment, the light panel includes a plurality of L.E.D.'s which are attached to the light panel to form a picture or other suitable image such as an image associated with the theme or themes of a game. It should be appreciated that the picture or image may be any suitable picture or image desired by the game implementor. In one embodiment, the substantially
20 transparent panel includes an opaque coating or tinted coating which prevents a player from viewing the L.E.D.'s until the L.E.D.'s are illuminated in a game. Once the L.E.D.'s are illuminated, the picture or image formed by the L.E.D.'s becomes visible and viewable by a player in the game.

In one embodiment, the L.E.D.'s are controlled by the processor to illuminate at designated time or times in a game such as when an image or images are indicated to a player or when any other suitable game function occurs in the game. In another embodiment, each of the L.E.D.'s are independently illuminated by the processor. In this embodiment, one or more of the L.E.D.'s may be illuminated at same time or different times to create different visual effects in a game or games. For example, the L.E.D.'s may be positioned to create an image or picture of fireworks exploding behind the display plates. In this example, one or more of the L.E.D.'s may be alternately illuminated to show one or more fireworks traveling upward on the light panel away from the bottom panel 107e of the frame 105. The L.E.D.'s are then simultaneously or alternately illuminated by the processor to show fireworks exploding on the light panel. In one embodiment, the L.E.D.'s include different color L.E.D.'s where L.E.D.'s including the same color or different colors may be illuminated to further enhance the visual effects of the L.E.D.'s in a game or games.

It should thus be understood that the mechanical display of the present invention may be used with a variety of gaming devices such as video poker machines, slot machines, blackjack machines, and keno machines.

It should be understood that various changes and modifications to the presently preferred embodiments described herein will be apparent to those skilled in the art. Such changes and modifications can be made without departing from the spirit and scope of the present invention and without

diminishing its intended advantages. It is therefore intended that such changes and modifications be covered by the pending claims.
